2. **Muscles:** Responsible for producing movement by contracting and exerting force on bones via tendons.
3. **Connective Tissues:** Including ligaments, tendons, cartilage, and fascia, these tissues support, stabilize, and facilitate movement.

Functions of the Musculoskeletal System

The system's primary functions include:

1. Providing structural support and shape to the body.
2. Facilitating movement through muscle contractions and joint actions.
3. Protecting vital organs within the thoracic and pelvic cavities.
4. Participating in hematopoiesis (blood cell formation) within bone marrow.
5. Storing minerals such as calcium and phosphorus.

Biomechanics of Human Movement

3. Rotation: Turning bones around their longitudinal axis
4. Circumduction: Circular movement combining multiple actions

Muscular Function in Kinesiology

Muscles are the engines of movement. They work in coordinated groups to produce precise actions.

Types of Muscle Contractions

1. Concentric: Muscle shortens while contracting (e.g., lifting a weight)
2. Eccentric: Muscle lengthens under tension (e.g., lowering a weight)
3. Isometric: Muscle contracts without changing length (e.g., holding a plank)

Muscle Roles in Movement

1. Agonists: Prime movers responsible for primary action
